## The PCF Guideline by TfS is the gold standard for calculating chemical product carbon footprints (PCFs).

The new TfS Guideline for Product Carbon Footprint [PCF] and Corporate Scope 3 emission reporting provides specific calculation instructions for emissions from “cradle-to-gate” for chemical materials. It harmonizes PCF calculation approaches across the industry and is applicable to the vast majority of chemical products.

### A solution built on sector collaboration

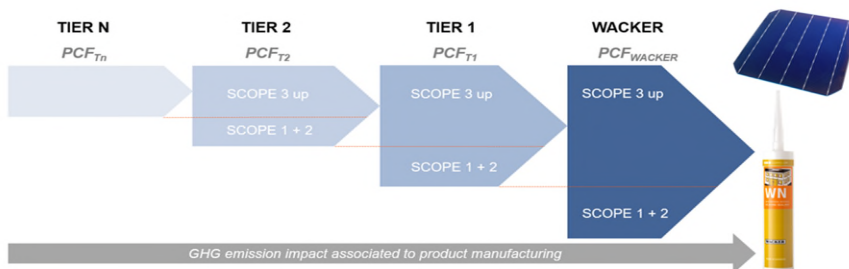

- ▶ Scope 3 emissions measurement is exceptionally challenging for our industry.
- ▶ Existing standards & guidelines do not provide the level of specificity and detail needed.
- ▶ TfS PCF guideline is aligned with other industry initiatives

### Chemical industry as a pioneer in product-level environmental data

PCF calculations provide the best product-level emissions transparency for the identification, tracking and reduction of Scope 3 GHG emissions. Furthermore, they enable companies and suppliers to work on the reduction of their emissions, which ultimately will improve the industry's carbon footprint.

## Determining the PCF Requires Data Owned by Suppliers along global Value Chains
